So, why use AI?

Our AI was trained by people with many years of experience in the technology transfer sector, with experience of investing in novel technology and brokering interactions between academics and those who develop the technologies that are built on the science conducted in the academy.

- But capturing that experience in an **AI-driven system allows us to apply that human insight globally**, adding new material to the dataset on a daily basis from wherever it emerges.
- Using AI allows us to **enhance the data** captured, looking for adjacencies or instantly mapping trends in novel technologies, even (especially) when they are pre-patent.
- Using AI means our **users can search hundreds of thousands of technologies** in seconds.

And, of course, our users are people. Our role is to support their intelligence and expertise with our data.

**The beta-version of this exciting new product
is now available**

Innovation DB

We named our product after the shield carried by Athena,
goddess of war – and of wisdom.

In Greek 'Aegis' is actually spelled 'Αιγίς' (Aigis),
which we thought fitted rather nicely.
